Pattern formation in Drosophila involves the formation of colour patterns in adult flies. In the pigmentation system, the adult colour patterns are derived from a series of imaginal discs that develop from the larval eye disc during pupation. These discs are genetically accessible and provide a useful system for investigating the molecular basis of pigment pattern formation. Here we describe a number of mutants that affect different aspects of disc patterning and show how these can be used to investigate the molecular basis of pigment pattern formation.I want to read your comments on this: Have you ever looked at a library catalog for books you want to read and seen a book that looks great? Or has something caught your attention? Even just having it in your possession? Are you willing to pay a small fee to get the book and go out and read it? Monday, October 21, 2013 Endlessly Prolific 2013 I got a little behind with my October Blog-a-Thon. But it's going to be tough to catch up now, because I can't get out of the habit of thinking about publishing (or not publishing) all the time. And I'm just SO ADDICTED to poetry-sharing. The first story, a friend's one, was actually submitted in 2011. It's called "Fireweed" and was written with my friend Stephen James. I was going to republish it here. But Stephen had a good piece to say about it, so we're going to share that. But I am going to allow him to tell you about Fireweed. Stephen: I was working on the West Coast on a movie set when my daughter asked what I was working on. "A movie." I told her. She said, "I'm on it."

Vascular endothelial growth factor (VEGF) is a critical mediator in tumor angiogenesis. In recent years, there has been a substantial interest in the use of VEGF as a diagnostic marker and therapy target in renal cell carcinoma (RCC). VEGF has been studied in many clinical trials; however, the results were inconsistent and have led to a state of confusion.

The purpose of this review is to summarize the current knowledge regarding the diagnosis and therapy of RCC using VEGF. RCC is a molecularly heterogeneous cancer. VEGF is a factor that plays a critical role in tumor angiogenesis. In RCC, VEGF promotes tumor angiogenesis and enhances RCC growth, invasion, and metastasis. Several clinical trials have been conducted to determine whether VEGF plays an important role as a prognostic marker and therapy target in RCC. However, the results of these studies have been controversial and require further investigation.WASHINGTON -- President Donald Trump is expected to sign an executive order Wednesday that seeks to limit legal and illegal immigration into the United States, drawing immediate criticism from both sides of the political divide. Trump's executive order would keep families together in federal custody for a period of time -- often months or years -- while they wait for their immigration cases to be resolved. Currently, migrant children are housed in separate facilities and often in indefinite detention. In addition, the order would cap the number of refugees entering the country at 50,000 for fiscal year 2017. That's an increase from the current refugee cap of 45,000 and the lowest cap in the past seven years. The sweeping order -- which would be the second such executive action this week -- marks the most aggressive attempt yet by the president to rein in immigration. So far, he has signed an order delaying the entry of refugees from certain countries and one stopping immigration from six majority-Muslim countries. Some key details of the new order remained under wraps, though administration officials said the order would also mandate that immigrants seeking asylum would need to do so at a U.S. point of entry. Trump will sign the order at the Department of Homeland Security, which could be made public as early as Wednesday afternoon. Republicans and Democrats are already lining up to denounce the order.
