Reliable, sensitive, and rapid assay for the kinase activity of protein tyrosine kinases in human fibroblast cell lysates. Protein tyrosine kinases (PTKs) are involved in signal transduction pathways, which regulate cellular proliferation, differentiation, and oncogenesis. Dysfunction of PTKs is linked to several human diseases. The characterization of PTKs' activity is essential in defining their functions. Here, we describe the development and application of a novel method for the assessment of PTK activities using a synthetic peptide substrate, a cell-permeable fluorescent phosphotyrosine derivative, and human fibroblast cell lysates. The method allows the rapid screening of multiple PTKs, with high sensitivity, in the presence of various cellular PTK inhibitors. Purification and properties of a new soluble enzyme of sphingosine metabolism in the rat. A new soluble enzyme of sphingosine metabolism was identified and purified from rat liver microsomes. The activity of the enzyme was indicated by the formation of free choline from 1-hydroxy-sphingosine and by the accumulation of S-hexadecyl phospho-L-serine in the tissue culture medium of rat hepatoma cells. The purified enzyme was shown to be a dimeric protein having a molecular mass of 110 kDa. The optimal temperature and pH for the enzyme activity was 32 degrees C and 8.0 respectively. The Km value for 1-hydroxy-sphingosine was 2.5 microM. The enzyme activity was inhibited by phenylthiourea, 2,3-butanedione, and N-ethylmaleimide. 1-Hyd
