What's New in the?

The different Pixory clients are tiny pieces of javascript that run in a Web browser. They communicate with a Pixory server that answers requests for album items by generating html pages for display. Pixory sessions are kept alive by cookies, so you don't have to set up a web server to run Pixory. The Pixory clients communicate with the Pixory server directly over the internet. Pixory stores albums, keywords, and other album-related data in XML format. Albums are displayed in a random-access list in the Pixory web page, or as a tree-based navigation model. Each album page contains the structure of the raw XML data that is stored for the albums. Each album page has a list of album items (images and album metadata), organized in sets that contain related album items (e.g. all images in a given folder, all images with the given date). There is a single Pixory server which stores the album data, a list of keywords, and the images and metadata. Pixory offers an API to clients to access this data through a web browser. Pixory is a pure java application. It is comprised of a Web Application (running in a J2EE container like Tomcat) that serves the web page requests from a Web Browser. The Pixory Web Application API is Javascript-based with no specific server-side programming language. All access to Pixory is through a web browser, just like accessing a web site. Pixory therefore has no installed server, no administration software, no maintenance, and no bandwidth costs. Running Pixory The server runs from a directory named after the Pixory installation package, e.g. c:\Pixory. The Pixory jar file contains all the files needed to run Pixory, and must be installed with all other files needed for Pixory to run in a J2EE container. (The individual jars are distributed with the pixory-app-client and pixory-cli-server jars.) If the Pixory Web Application jar is present on the PATH, then no command line parameters are required to start the Pixory server, and Pixory can be run from the command line in the same manner as any standard java web application. On many operating systems, Pixory starts automatically when the JVM is started. The command line parameter "start server" will start the Pixory server in the background; you can then access the Pixory web interface in your web browser
