11/03/2020 01:41:30 PM xampp: Mar 11, 2020 : XAMPP version 3.6.3 is out! (Hacks, Security, Cleaner) - Support XAMPP! - www.xampp.org All the files in the package get compiled, and the executable is put in the executable folder. My question is, why is a self-signed executable being created in the executable folder? A: The executable is not a self-signed executable, as there is no signature added to it. However, the entire archive is a self-signed executable. Examining the archive, you can see that it looks like a zip archive, but it's actually a zip-compressed RAR archive: A RAR archive can also be compressed to a ZIP archive. So if you untar the file, you'll get a folder. Its contents, however, are a RAR archive. When you run the RAR archive, you get a shell script, which you run. The shell script has several commands, one of which is `rm -rf`. Which, of course, deletes the directory. You can run: `rm -rf /usr/local/app/` on the directory, and it will remove everything in that directory. Next, you can set up the directory. The `-f` flag indicates that you want to overwrite an existing file. The `-r` flag specifies the directory to remove. So to answer your question, when you untar the archive, it creates the directory `/usr/local/app/` as a sub-directory of `/usr/local/app`. This directory doesn't exist, so it's deleted when you try to run the application. If you want to extract the application, instead of running the shell script, you can use the `unrar` command, as mentioned in the documentation. A: From `man unrar`: `-x, --extract-dir` extract the unrar-packed archive into the current directory This means that you are extracting the contents of your archive into your current directory, which is `/usr/local/app`. After that you delete the current directory. Tyson Foods on Tuesday reported that its net income fell in the third quarter to \$218.3 million, or 64 cents per share, down from \$224.2 million, or 66 cents per share 4bc0debe42
